Which suse version do you have?

Specifically, we do not currently provide suse rpms, but the ones made for redhat should be OK. Latest vzctl (an utility to control VPSs) version that fixes initscript to work with SuSE will be released today or tomorrow.

As for the suse VPS, there is a opensuse-10 precreated VPS template available. Unfortunately for its networking to work it requires some stuff from kernel (sysfs support from inside a VPS), and this is off by default in our kernel. The situation will be fixed with the release of 068 (or later) kernel there sysfs can be turned on/off per VPS. For now, you need to change one config setting and recompile the kernel to get opensuse-10 template working.

Our future plans include releasing a custom kernel which is basically SuSE kernel (all the SuSE patches and stuff) with OpenVZ functionality added. We will also be creating more suse templates.

Kir.
