I strongly suggest you to use vzcfgvalidate utility to check your VE config. For example, this is what it told me on your config:

Error: barrier should be equal limit for numproc (currently, 85:95)

Error: barrier should be equal limit for numtcpsock (currently, 95:100)

Error: barrier should be equal limit for numothersock (currently, 95:100)

Error: limit should be = 9223372036854775807 for vmguarpages (currently, 262144)

Error: limit should be = 9223372036854775807 for oomguarpages (currently, 131072)

Error: limit should be = 9223372036854775807 for physpages (currently, 1048576)

Error: kmemsize.bar should be > 2736128 (currently, 16384)

Warning: privvmpages.bar should be > 32768 (currently, 16384)

Error: tcpsndbuf.lim-tcpsndbuf.bar should be > 243200 (currently, 114688)

Error: othersockbuf.lim-othersockbuf.bar should be > 243200 (currently, 114688)

Warning: tcprcvbuf.lim-tcprcvbuf.bar should be > 243200 (currently, 114688)

Warning: tcprcvbuf.bar should be > 65536 (currently, 16384)

Warning: tcpsndbuf.bar should be > 65536 (currently, 16384)

Warning: dgramrcvbuf.bar should be > 32768 (currently, 16384)

Warning: othersockbuf.bar should be > 32768 (currently, 16384)
