Looks really great, thanks! Can I put it to  
download.openvz.org/contrib/? I am also interested in putting your template.

From the quick review (no testing yet) I see the following really nice  
things:

- \* LVM2 support
- \* a man page
- \* the fact that you honour both /etc/vz/vz.conf and /etc/vz/conf/\$VEID.conf
- \* rpm/deb packages

Problems:

- \* in fact the only problem I see is that the source tarball does not contain the top-level directory (usually \$NAME-\$VERSION/), so if you untar it all the files are extracted to the current directory which is not good.
- \* perhaps having a .spec file for rpm will be better than using alien to build rpm. I can mock up one if needed.
