You are aware of the fact that privvmpages is measured in pages right?

So in fact your privvmpages limit is 544MB. That still doesn't explain the fact that there is a gap of 28009 pages (109MB) between your maxheld and limit.

It could be that at a certain point you VE tries to allocate 109MB+ memory although I have my doubts about that.

What do you exactly mean by "I'm running out of allocated memory that isn't actually being used."
?
