```
[root@localhost ~]# rpm -q kernel
kernel-2.6.9-42.EL
[root@localhost ~]# rpm -V kernel-2.6.9-42.EL
[root@localhost ~]#
```

Doesn't look like anything is changed...

```
cat /etc/modprobe.conf:
alias scsi_hostadapter ahci
alias eth0 e100
alias eth1 e1000
alias eth2 e1000
```

if that helps you, I have tried both the e100 port and the e1000 port and neither one works.

I have also had problems installing the newer operating systems on this system (FC6/CentOS 5 Beta gave me Python errors during install based on 2.6.18 kernel) to so I wonder if something is wrong with the compatibility? You'd think that this would work better with the newer OS since it is the newest technology (quad core) but who knows.
