Just to keep you updated....

I installed a fresh install of CentOS4 and installed just the plain ovzkernel (not SMP) and it actually booted up but I am still running into the problem when it is trying to start the NIC and it gives me the 192.168.1.1 ping timeouts.

It looks like:

```
Starting eth1: [failed] PING 192.168.1.1 (192.168.1.1) 56(84) bytes of data.
```

```
--- 192.168.1.1 ping statistics ---
```

```
4 packets transmitted, 0 received, 100% packet loss, time 3000ms
```

192.168.1.1 is my router IP, but I've never seen an error like this when booting up a NIC until this system.
