I don't think the problem is DHCP related after all, I disabled DHCP on the server and put in the actual address in the ifcfg-eth1 file.

It now boots up the device saying...

Bringing up interface eth1:   [OK]

but I still have no remote access to the server on the OVZ kernel, while using the CentOS kernel I have remote access through my switch but I cannot access the internet (probably because my home router requires DHCP use to access the internet).

Now I'm just as lost as ever :-/
