GrrrlRomeo wrote on Thu, 22 March 2007 05:43privvmpages is memory that has been allocated by applications but not necessarily used. oomguarpages is the amount of memory actually use (in this case actually 211MB). That's what I've read anyway.

True, but memory which is allocated can't be allocated by other VE's so it seems only logical that the value of privvmpages is used to measure the current memory which has been assigned to the VE?

To be honest, I still don't understand the memory assignment very well but learning along the road.
