
Subject: VZDump problem

First, I wish to thank the contributor of VZDump, which looks like a fine utility. I am having a little trouble with it though. I am running OpenVZ on a Debian Etch machine with a 2.6.18 kernel. When I try to use VZDump it complains that it can not find the VPS I specified. Am I doing something wrong?

Thanks...

```
actual:/etc/vz/conf# vzlist
```

VEID	NPROC	STATUS	IP_ADDR	HOSTNAME
101	11	running	72.46.65.29	nsp3.abcde.com
102	11	running	72.46.65.30	nsp4.abcde.com
103	14	running	72.46.65.46	mail6.abcde.com
104	21	running	72.46.65.47	mail5.abcde.com
105	26	running	72.46.65.48	whois.abcde.com
1000	4	running	72.46.66.10	vps1000.abcde.com

```
actual:/etc/vz/conf# vzdump 1000
```

```
ERROR: unable to find VPS '1000'
```

```
usage: /usr/bin/vzdump OPTIONS [--all | VPSID]
```

--compress	compress dump file (gzip)
--dumpdir DIR	store resulting files in DIR
--xdelta	create differential backup using xdelta
--mailto EMAIL	send notification mail to EMAIL
--stop	stop/start VPS if running
--suspend	suspend/resume VPS when running
--snapshot	use LVM snapshot when running
