Funny!
I had also a problem with it.
I used the same kernel source, because I wanted to recompile it to use ipt_ULOG in my iptable firewall.
But after using it a couple of times, I give up, because it was always crashing (the system freezed and I had to use the restart button).
Now I'm using 2.6.18-ovz28stab21.1-smp with no problems (but also without recompiling).
