---

yes i been service httpd restart  
after fill the information  
Create VPS:

If no errors, Linux OS was just created

Set VPSID 111 onboot = yes

Added 192.111.111.232 to VPSID 111

Added hostname 1111.com to VPSID 111

Set root password as admin for VPSID 111

I just started VPSID 111, you should now be able to shell into 192.111.111.232 using user root  
and password admin  
i check bash command  
vzlist --all  
no vps found  
and i create manual  
like  
vzctl create 101 --ostemplate centos4 \*\*\*\*\* is work ok  
or fedora ok  
another tip to check  
god bless you !!!
