ok, that sounds good, I'll have a try with SuSE.

Subject: Re: openvz and SuSE

I've started now with installing fedora-core 4 and updated the kernel as mentioned, some prebuild VPS are still running. But how can I access now some physical harddiscs? I need to mount /dev/sdd1 (my data partition). How to enable the second eth interface?

so you update this kernel with actual patches and the OpenVZ Users could install the new one everytime it's released?
