The last message in my messages was out of socket memory and the TCP: out of orphans and my server would go unreachable.

I fixed the problem by reverting to the older 2.6.18-015 kernel. This problem only occured for me under the new 018 and 021 kernels. My system hasn't crashed in a couple days but I just realized I do have those out of socket memory messages again. The main message in my console with the 015 is TCP: time wait bucket table overflow tho. Any idea what that is?
