Hello,

Thank you for the information. I'd like to note, that running the older kernel doesn't check if the hardware is broken. The thing is that, one kernel can perfectly work on broken hardware, but the other kernel will uncover a defect in hardware. So, in order to surely check hardware, please, read this small article: http://wiki.openvz.org/Hardware_testing

If it is not a hardware flaw, but OpenVZ kernel bug, please, install serial console on the node and after freezing of the node, check, if there is a panic on console. If there is no panic, please, press magic buttons (http://wiki.openvz.org/Magic_SysRq_Key) and send the information to us (for example via bugzilla).

We appreciate your help very much,
thank you,
Vasily.
