I personally prefer that way, so I can easily see what's going
on in the VPS. But there should be some additional info from
which VPS the stuff is coming from. Maybe the VPS' process names
could contain some prefix ie. "[${VPSID}]".

That could be an killer requirement for the virtualization.

I do not yet completely know what my current customer really needs
here. But I can imagine they want to isolate routing stuff.

For my own projects, I'll need an completely virtualized routing,
so I can easily use VPS'es as VPN hub, just as they were dedicated
machines.
