Hello !

I've found only one thread in russian about this...

My internet provider made some maintenance works and after that i noticed that my HN was inaccessible.

I was able to login via ssh but it didn't accept any commands.

When i arrived at the server's console the message "dst cache overflow" was printed on the screen from top to bottom.

After some googling i've found out it's a bug in the kernel.

My question is that the latest stable 2.6.9 kernel has it fixed according to this ?

http://lists.linuxcoding.com/rhl/2005/msg19362.html

Is there a way to find out that the kernel i have installed suffers from this bug ? Besides the symptom that allready presented.

One more thing, i'm using the 2.6.8-022stab078.14-smp kernel.

Thanks !
