Hello,

There are soft limit and hard limit in OpenVZ disk quota. Disk usage over soft limit is permitted only during grace period. After this period expires, soft limit is enforced as a hard limit. So your provider can configure soft limit and grace period.

But! Note, that anyway, df and other tools that use statfs system call will receive information, that there is no available space, but they'll be able to write. I'm rather sure, that Plesk gets information namely by this syscall (or just by parsing dd/stat output). So setting softlimit and grace period by your provider will help only partially.

HTH,
Vasily.
