Hello, after our testing we have the following results:

VE0 <-> VE0: 878.95

VE <-> VE: 793.68

VE0 (cl) <-> VE (serv): 872

VE0 (serv) <-> VE (cl): 800

(VE0s and VEs are on different nodes, server was always ran on one node and client on another)

So we had an overhead of 10%

After we swiched clien and server, we received the following results:

VE0 <-> VE0: 920.84

VE <-> VE: 910.84

Overhaed about 1%

So we want to know your environment more precisely. Note that for our testing iptables modules were unloaded, routing was very easy (default), subnet contained only two nodes. Also inform us about your CPU, network cards, etc.

Thanks.
