Hello,

Thank you for investigating the issue, now I can explain you what's the problem.

When CONFIG\_UBC\_KEEP\_UNUSED is on, all VEs (even stopped) still have entries in /proc/user\_beancounters. Held field in this file for stopped VEs equals 0 in this case. vzcalc/vzmemcheck use /proc/user\_beancounters to get required values and they go crazy if held value is 0!

I consider such situation as a bug, so, please, fill the report in bugzilla.

Thank you once again,  
Vasily.
