Hello everyone,

When building the RHEL5 kernel (from ovzkernel-2.6.18-8.el5.028stab027.1.src.rpm) with XEN-Compatible subarchitecture, it fails with this error...

```
CC arch/i386/kernel/process-xen.o
arch/i386/kernel/process-xen.c: In function `show_regs':
arch/i386/kernel/process-xen.c:213: error: `system_utsname' undeclared (first use in this function)
arch/i386/kernel/process-xen.c:213: error: (Each undeclared identifier is reported only once
arch/i386/kernel/process-xen.c:213: error: for each function it appears in.)
make[1]: *** [arch/i386/kernel/process-xen.o] Error 1
make: *** [arch/i386/kernel] Error 2
```

Any clues or workarounds available for this??

Thanks in advance
