
Subject: RT priority processes in a VE.

G'day. I am using OpenVZ to split a few servers for security and management reasons -- all the VE environments are run by me and trusted and all that.

As part of this I want to run some software in the VE with real-time priority threads (Asterisk, possibly other software) in our system.

Unfortunately I can't work out what settings, if any, make it possible to permit this inside the VE and reading the kernel patch didn't help.

Is it possible to run a process with FIFO scheduling priority in a VE?

If so, how do I permit this?

Regards,
Daniel
