Ok. I think I understand it now.

The privvmpages is for the allocated RAM which can be unused so it's always greater than the real memory usage. If I limit this option my customers (not all the VE's belongs to me, some are rented to others) get smaller resources than I defined. It's not good behaviour to me.

The physpages is the amount of the used memory. It's always below or equal than the privvmpages value. But the manual said this is only accounting parameter. I think there will be no effect if I changed it. IMHO.

What will happen if I set the privvmpages to unlimited and the physpages to 320M? It will simulate a machine with 320M RAM (thats my destiny) or it doesn't limits the memory at all?

Thanks,

Arpad
