I just tested with more memory and it hasn't helped, but I am guessing that it might be the system memory that just isn't enough. Can someone suggest how I would go about ensuring that I truly do need to upgrade my system memory. I have done some simple tests using free -m and vzmemcheck but am not confident that I understand the statistics it reports.

HN:

=====

[root@hostnamelvz opt]# vzmemcheck

Output values in %

LowMem LowMem RAM MemSwap MemSwap Alloc Alloc util commit util commit util commit limit 0.40 58.62 5.18 1.75 7.70 2.52 30.70 41.13

VE:

=====

[root@hostnamelvz-1 bin]# free -m

total used free shared buffers cached

Mem: 1007 441 566 0 17 239

-/+ buffers/cache: 184 822 Swap: 1983 44 1939

Any suggestions are welcome.

I am trying to attach the JAVA traces and dumps from the "out of memory" error... but the site is having issues I guess. I just tried again, the errors seems to depend on the size of the file.
