I just tested with more memory and it hasn't helped, but I am guessing that it might be the system memory that just isn't enough. Can someone suggest how I would go about ensuring that I truly do need to upgrade my system memory. I have done some simple tests using `free -m` and `vzmemcheck` but am not confident that I understand the statistics it reports.

HN:

=====

```
[root@hostnamelvz opt]# vzmemcheck
```

Output values in %

LowMem	LowMem	RAM	MemSwap	MemSwap	Alloc	Alloc	Alloc
util	commit	util	util	commit	util	commit	limit
0.40	58.62	5.18	1.75	7.70	2.52	30.70	41.13

VE:

=====

```
[root@hostnamelvz-1 bin]# free -m
```

	total	used	free	shared	buffers	cached
Mem:	1007	441	566	0	17	239
-/+ buffers/cache:		184	822			
Swap:	1983	44	1939			

Any suggestions are welcome.

I am trying to attach the JAVA traces and dumps from the "out of memory" error... but the site is having issues I guess. I just tried again, the errors seems to depend on the size of the file.
