I just tested with more memory and it hasn't helped, but I am guessing that it might be the system memory that just isn't enough.   Can someone suggest how I would go about ensuring that I truly do need to upgrade my system memory. I have done some simple tests using free -m and vzmemcheck but am not confident that I understand the statistics it reports.

HN:
=====
[root@hostnamelvz opt]# vzmemcheck
Output values in %
 LowMem LowMem   RAM MemSwap MemSwap Alloc Alloc Alloc
  util commit   util   util commit   util commit limit
  0.40 58.62   5.18   1.75   7.70   2.52 30.70 41.13

VE:
=====
[root@hostnamelvz-1 bin]# free -m
         total   used   free   shared   buffers   cached
Mem: 1007   441   566   0   17   239
-/+ buffers/cache: 184   822
Swap: 1983   44   1939

Any suggestions are welcome.

I am trying to attach the JAVA traces and dumps from the "out of memory" error... but the site is having issues I guess. I just tried again, the errors seems to depend on the size of the file.
