I did what you recommended and the only value in the "failcnt" column that appears to have changed during the tests was the "numproc".

See attachments for more details...

but here is the low down:

Test 1: prior to start websphere I ran "cat /proc/user_beancounters" and saved it to a file: user_beancounters_prerun

Test 2: during the websphere startup I ran the command again: user_beancounters_duringrun

Test 3: a few minutes into the startup process I ran the command again: user_beancounters_duringpostrun

Test 4: after "ctrl +c" in the terminal windows that started websphere I ran the command again: user_beancounters_duringpostrun2

I don't see anything glaring... perhaps I am missing something?
