
Subject: vzctl create --root and vzyum and get_veid

Hello !

If I create a virtual machine with the following command:

```
# vzctl create 101 --ostemplate ... --config ... --root /a/b/101
```

then the following command fails:

```
# vzyum 101 install ...
```

I have modified the function 'get_veid()' into the file '/usr/share/vzpkg/functions' replacing the string 'get_vz_var' with 'get_ve_var' and vzyum works correctly.

It's a bug or I misuse the vzctl and vzyum commands ?
Is my patch correct ?

Thank you for reading.

Cesare
