Subject: Re: DHCP Server in VPS?
Posted by dev on Sun, 05 Feb 2006 09:22:20 GMT

VPS network device is PPP-like, it acts as a router for IP packets, and doesn't work on ethernet level, nor forwards ARP requests, broadcasts and so on. This is done so for security reasons.

You can install 2nd NIC and give it for exclusive use of VPS via
vzctl set VPSID --netdev_add ethX

In future we will implement ethernet like network device for VPSs.
