Hello,

As far as I understand, being on usual HN with such usb dongle, you use some user-space tools, that check the presence of the dongle (and probably some certain information on it) and if it exists - the tools start to work. Otherwise their don't work, right?

If so, then we should now how this user-space tools check for presence of the dongle... E.g. you can use `strace` for investigating it.

Vasily.
