Hello,
I've created a CentOS 5 template based on centos-4-i386-minimal.

To create the template i've used the following steps:
Quote:
1 - Create a VPS with centos-4-i386-minimal
2 - Download the files to /vz/private/VEID/
centos-release-5-0.0.el5.centos.2.i386.rpm
centos-release-notes-5.0.0-2.i386.rpm
initscripts-8.45.14.EL-1.el5.centos.1.i386.rpm
3 - Enter in VPS
3 - Update the first two packages
4 - Force initscripts install with --nodeps
5 - Import the new RPM-GPG key
rpm --import http://mirror.centos.org/centos/RPM-GPG-KEY-CentOS-5
5 - Exit from VPS
6 - Change vps config file
OSTEMPLATE="centos-4-i386-minimal"
to
OSTEMPLATE="centos-5-i386-minimal"
7 - Upgrade the remaining packages without issues
vzyum VEID upgrade
8 - Delete .rpmsave and backup files from VE
9 - Create the template

Template is available for download here
