Subject: Logging traffic stats for VEs

Hi all,

I need to graph the traffic usage for each VE. I've seen on the wiki that I should use iptables for this, but it seems to me that there should be some kind of counter as part of the openVZ counters - is there?

My concern with using iptables is that in a situation when you have multiple hosts, the VE could be moved around between hosts a fair amount, and therefore the iptables counters won't be relevant.

I'm sure someone must have solved this issue before, care to share?

Thanks,
