Subject: Net:Registered protocol family 16

Help- New OpenVZ kernel is used getting an a boot error that hangs the boot of "Net:Registered protocol family 16" when installed on a CentOS version 4.4 server. Note this server had all updates installed first prior to OpenVZ kernel install. Is this an issue or is this a bug of some type as we found an updated tool "Error: 1ksctp\_tools conflicts with kernel >= 2.6.10" had to be removed to even load the OpenVZ kernel download install at first . Considering reinstall of CentOS with no updates if this is recommended for normal install of this kernel? Any feedback appreciated as soon as possible.
