Hey,

I've been working on some scripts that make VPS Management easier...

Hopefully I will get them into a web gui eventually but for now I doubt it...

Heres what I've done so far:

File Name: createvps.sh

Usage: ./createvps.sh [VPSID] [OSIMAGE] [CONFIGFILE] [HOSTNAME] [IPADDRESS]
[NAMESERVER] [PASSWORD] [ONBOOT]

Explanation: This is used to create new vps's... it will create a vps and set hostname, ip, nameserver, password and yes/no for start on boot.

That's the main file. I've created a few more:

destroyvps.sh = Destroy VPS with specified ID

restartvps.sh = Restarts VPS with specified ID

stopvps.sh = Halts VPS with specified ID

startvps.sh = Starts VPS with specified ID

listimages.sh = Lists all files in /vz/template/cache

addip.sh = Adds IP to vps with specified ID

I will be making a few more before I release it, but I'm wondering. Do you guys like what I have so far?

Are you interested in this type of thing?
