OK, I can't find appropriate posts at the moment either! So I explain the problem once again. The thing is that when you produce mount command on HN (e.g. from 101.mount script), the entry in /etc/mstab on HN appears. Later when VE stops all mount points in VE are unmounted automatically even `_without_` umount script. But the entry in /etc/mstab is still there! It makes mount a bit crazy...

So, you should use ``mount -n`` in mount script and don't use umount script at all.

HTH,
Vasily.
