Hi Kir, I feel this modification will block yum openvz based kernel updates as well. I believe this is why the kernel images used to be called openvz-\*kernel-\* or something like this, but dag wieers made a strong case to change it to kernel-\*

Now, the package is:  
/028stab031.1/kernel-2.6.18-ovz028stab031.1.i686.rpm

I don't know if there is a way around this, we need a regex match on yum exclude directive.
