About one month later, with a new HDD it happened again, in the same conditions.

When i was compiling some stuff and the node load average goes up to 100, it start giving me errors.

laxvps kernel: journal commit I/O error

[root@laxvps ~]# dmesg -a | less -bash: /bin/dmesg: Input/output error Segmentation fault

Is there any way to check if the problem is related with my node/ve I/O prios?
