It is initrd script.

Here is the script:

hernad@desk-h8:~/openvz/temp$ gzip -dc /boot/initrd.img-2.6.18-033-b | cpio -id
22897 blocks

hernad@desk-h8:~/openvz/temp$ cat scripts/init-premount/udev
```
#!/bin/sh -e
# initramfs premount script for udev

PREREQ=""

# Output pre-requisites
prereqs()
{
     echo "$PREREQ"
}

case "$1" in
   prereqs)
     prereqs
     exit 0
     ;;
esac

# It's all over netlink now
echo "" > /proc/sys/kernel/hotplug  <<<< LINE 21

# Start the udev daemon to process events
/sbin/udevd --daemon

# Iterate sysfs and fire off everything; if we include a rule for it then
# it'll get handled; otherwise it'll get handled later when we do this again
# in the main boot sequence.
/sbin/udevtrigger
```

I have checked, thre is no difference between initrd.img of this 033-HEAD, stab033 i stab031
kernel.

I don't know how to provide you log of initrd process.

System cannot acces root file system (/dev/mapper/Ubuntu-root).

Thank you.
