Hi All,

Debian Etch, running etch's standard openvz install. create a bunch of VE's, all work fine. Standard iptables, NAT, etc - network access works.

apt-get install from within a VE, the download will hang. apt needs to be restarted several times to get the whole file down. No such problems from the HN. I am pretty new to OpenVZ, and am mainly used to Xen and VMWare.

running wget on the commandline doesnt show this issue.  
Any pointers?
