Well, as I understand you just need a network interface inside VE which is separated from another VE. Right?

Then you just need to create a VE and assign an IP address to venet interface with help of following command:

vzctl set VEID --ipadd IP --save

And you don't need to create vlans at all. Two bonded interfaces will be in host system and you don't need to move them to VE.

Please correct me if I misunderstood your configuration and needs.
