Hello,

Even in your situation, when "VPS's are on the same main server from the same provider, using the same OS with identical kernels", it can happen, that one VPS is able to apply iptables rules and the other one is not able to do it. The following two reasons I see:

1. One of VPSs (the one, that can't work with iptables) was started later then iptables kernel modules were loaded by provider on HN. To check it - reboot your VE. If after reboot iptables still doesn't work - see 2nd reason.
2. Your provider have different configuration files for the VPSs in question. In VPS config file provider indicates, which iptables modules are available in this VPS. So, probably the line with iptables is just missed in "not working" VPS config file. In this situation you should contact your provider and ask him to check configuration.

HTH,  
Vasily.
