looks ok. I ran into this problem a few times. what I did to solve it in a few minutes was edit the apf script, and have it echo out the iptables commands as it runs them,. that way, you can see what the command is that is causing the errors:

iptables: No chain/target/match by that name

apf isn't a firewall, but an iptables wrapper script. to know whats going on, you need to edit the apf script to print what its doing.

once you have the specific iptables rule which is failing, the problem should be obvious.
