I can not open /dev/tty0.

"DEVICES="c:4:all:rw" does not help.

/dev/tty works, but /dev/tty0 does not.

This is feature? or possible to solve this?

It is Okay to run Apache/Sendmail,

but a bit inconvenient for debugging or development or such purposes.

OpenVZ version: 2.6.18-028stab033

[If you dont add "DEVICES=c:4:all:rw" line to vps.conf]

```
# cat /dev/tty0
```

```
cat: /dev/tty0: Permission denied
```

[If you add "DEVICES=" to vps.conf]

```
# cat /dev/tty0
```

```
cat: /dev/tty0: No such device
```

(anyway, you can not access /dev/tty0. Why? This is inevitable feature?)

```
# ls -la /dev/tty0
```

```
crw----- 1 root tty 4, 0 May  6 11:39 /dev/tty0
```

```
# uname -r
```

```
2.6.18-028stab033
```
