I still have not solved this issue.  
You change something on /dev/tty[0-9] in a VE?  
I guess they are not same as usual ones.

-----

I can not open /dev/tty0.  
"DEVICES="c:4:all:rw" does not help.

/dev/tty works, but /dev/tty0 does not.  
This is feature? or possible to solve this?  
It is Okay to run Apache/Sendmail,  
but a bit inconvenient for debugging or development or such purposes.

OpenVZ version: 2.6.18-028stab033

--- Okajima, Jun. Tokyo, Japan.

```
[ If you dont add "DEVICES=c:4:all:rw" line to vps.conf ]
# cat /dev/tty0
cat: /dev/tty0: Permission denied
[ If you add "DEVICES=" to vps.conf ]
# cat /dev/tty0
cat: /dev/tty0: No such device
( anyway, you can not access /dev/tty0. Why? This is inevitable feature? )
# ls -la /dev/tty0
crw----- 1 root tty 4, 0 May  6 11:39 /dev/tty0
# uname -r
2.6.18-028stab033
```
