oops, sorry. Ok. the last thing I would do, is reassign the IP which you have in the VE to eth0:10 on the HN, and try "ping openvz.org -I IP", specify that IP as the source. If that works, its an openvz problem and someone else will have to throw some ideas at this, as I am empty.

If doesn't work, reboot your box into the non openvz kernel, and do the same thing. If you can't ping with that source from the HN (non vz kernel) again, its not a openvz problem.
