I experienced the same problem when using my custom .config for 2.6.20.

After applying the first patch (mentioned above, the second is already included in the patch-ovz005.1-combined) and disabling some NFS features in .config, I compared my .config with the ones offered at <http://download.openvz.org/kernel/branches/2.6.20/2.6.20-ovz005.1/configs/> which revealed that

CONFIG_VZ_CHECKPOINT is not set

is by default disabled. Disabling it also in my custom .config worked. However you wont be able to migrate running vz instances anymore.

ciao, axel
