Hi. here is what I would do to narrow down the problem a bit

1) assign 10.80.5.71 as ethX:100 on your HN. duplicate the packet loss problem.

a) If no packet loss, come back to this forum and tell us as it is likely an openvz problem, and the devs will want to further analyze whats going on.

b) If the packet loss occurs again, reboot the HN into the non-vz kernel, turn up ethX:100 on 10.80.5.71. duplicate the packet loss problem. if the problem still occurs, its a problem on your network, possibly an ip conflict. if the problem does not occur, come back and post results on the forum as it may be an openvz related problem.
