Hi all,

Did anyone fight the same thing as me?

I am doing some tests before any real consolidation. I need more permanent veth in one VPS machine. I have followed how&to in your wiki [http://wiki.openvz.org/Virtual\\_Ethernet\\_device](http://wiki.openvz.org/Virtual_Ethernet_device) but with no sucess. It

seems there is problem in script /usr/sbin/vznetaddoute in line

```
VZHOSTIF=`echo $NETIF |sed 's/^.*host_ifname=\\(.*)\\.*/$1/g`
```

I am not able to resolve what author of the script wants use as

VZHOSTIF.

I would like to add that normal configuration one time configguration on VPS is working.

Do someone has working this script on Debian etch, 2.6.18 distrib kernel with openvz patch applied?

Thanks for any help

BR
