Sorry, don't get you.

Assume, you have /vz on /dev/hda1. It means, that VEs private files are located in
/vz/private/<veid>. Then you have one more hard disk: hdb. After `vzctl mount` command you can
give the following command:
mount /dev/hdb1 /vz/root/<veid>/var After `vzctl start` your VE will be able to write in /var as much
information, as big is hdb1 (but not /vz)

HTH,
Vasily.
