This should give you a taste for things to come. Just make a symlink from where you extract these files in /var/www (call it robovz for easy install) and copy the apache2-include.conf file to Apache2's include folder (Debian's is /etc/apache2/sites-available)

Make sure you import the two SQL dumps, and create two user accounts, one with the username and password of likah, and the other one with the username and password of robovz.

Run this command in the directory RoboVZ was extracted to:

```
tim@timg.ws:~/RoboVZ/# sudo php server.php
```

The Likah server __MUST__ be ran as root, otherwise it does not get access to OpenVZ's information, and cannot stop and start machines.

[Note: this is the reduced version. Watch this spot]

If you have any ideas, please, pretty please share them. Also, if in the future someone would like to put in something like Paypal, I would really like it if you could share the code with me
