Like I said, yes.

The lack of an IPTABLES entry on the CentOS 4 HN+VE = I get /proc/net/ip_conntrack, while the lack of an IPTABLES entry on CentOS 5 HN+VE = I don't get /proc/net/ip_conntrack, however if I *do* add an IPTABLES entry it works fine. The manpage for vzctl states that if there aren't any restrictions (i.e. no IPTABLES entry) then all loaded modules are enabled (which on CentOS 5, doesn't appear to be the case).
